

Global Investment Views Monitor: Prompt Library

Operational prompting documentation for a semi-automated
AI market intelligence workflow

By: Elias BANON

Academic Year: 2025–2026

1. Purpose of this Prompt Library

This document presents a cleaned and consolidated version of the main prompts used during the development of the Global Investment Views Monitor. The objective is to document how generative AI was used across the project, from initial design to workflow automation, report writing, quality review and final portfolio packaging. The prompts are intentionally detailed. They show that the project was not built from a single generic instruction but from a structured prompting process. The AI was used as a project design assistant, workflow architect, writing assistant, automation support tool and strict examiner. The prompts also reflect the main governance principle of the project: the large language model is used as an analytical assistant, not as an investment decision-maker. The instructions restrict the source universe, preserve institutional attribution, prevent unsupported figures and maintain a human validation boundary before distribution.

Table of Contents

I.	Initial Project Framing	p.2
II.	Source Map and Database Design	p.2
III.	Weekly Brief Template Design	p.3
IV.	Scheduled AI Task Master Prompt	p.4
V.	Source Discipline and Attribution Rules	p.11
VI.	Make Automation Setup	p.12
VII.	Usage Note	p.13

1. Initial Project Framing

Objective: Define the overall project idea, scope, target use case and expected portfolio value.

Prompt text:

I want to build a finance portfolio project based on generative AI. The objective is not to create a trading model, investment recommendation tool or portfolio allocation engine. I want to build a professional market intelligence workflow that could be relevant for asset management, wealth management or investment strategy teams. The project should monitor public macro news, public institutional investment views and cross-asset market signals. It should produce a weekly report that identifies:

- *the macro and market backdrop*
- *key market reactions*
- *institutional investment views*
- *cross-asset implications*
- *consensus between institutions*
- *divergences between institutions*
- *narrative shifts over time*
- *key risks to monitor*
- *reliability limitations*

Help me define the project concept, the workflow architecture, the tools required, the source universe, the analytical framework, the expected outputs. The project must be realistic, not too long to build, and should rely on a small number of tools. It should demonstrate finance knowledge, AI workflow design, source discipline and professional reporting.

2. Source Map and Database Design

Objective: Design the Google Sheets source map and workflow database

Prompt text:

Help me design the Google Sheets database for the Global Investment Views Monitor. The Google Sheet should act as the source of truth for the workflow. It should not only be a list of links. It should structure the full process from source monitoring to report generation. The source universe should be organised into three layers:

- *Layer 1: macro and market media;*
- *Layer 2: official institutional investment publications;*
- *Layer 3: CIO and strategist qualitative signals.*

Layer 1 should include macro and market media sources used to describe the weekly market backdrop, index movements, macro developments, policy events and risk events. These sources must not be treated as official institutional investment views.

Layer 2 should include official public institutional publications from private banks, asset managers, wealth management platforms and investment strategy teams. These sources should be used to identify official cross-asset views, positioning signals, consensus, divergences and changes in market narratives.

Layer 3 should include selected public commentary from CIOs, strategists, economists and investment specialists. This layer should be treated as more qualitative and indirect. It can enrich interpretation, but it must not automatically be treated as a formal house view unless the source explicitly presents it as an official institutional position.

Design the tabs of the Google Sheet, explain the role of each tab and suggest the columns needed. The database should include:

- *source map*
- *analytical framework*
- *weekly run log*
- *source checks*
- *cross-asset views*
- *consensus and divergences*
- *risk dashboard*
- *narrative shifts*
- *prompt library*
- *CIO watchlist*
- *brief output*
- *task control*

The structure must make the workflow auditable, repeatable and suitable for a professional finance project.

3. Weekly Brief Template Design

Objective: Create the structure and tone of the weekly investment intelligence report.

Prompt text:

Help me design a professional weekly investment views brief for the Global Investment Views Monitor. The report should look like an institutional market intelligence note, not a generic AI summary. The report should include:

- *cover page*
- *executive view*
- *source coverage*
- *macro and market backdrop*
- *market reaction*
- *cross-asset intelligence*
- *institutional consensus*

- *institutional divergences*
- *institutional view changes*
- *market narrative shift*
- *risk monitor*
- *reliability assessment*
- *important information or disclaimer*

The tone should be professional, concise and suitable for asset management, private banking or investment strategy teams. The report must not provide investment advice, trading signals or portfolio recommendations. It should present public institutional views and analytical interpretation in a clear and controlled way. The structure should be reusable every week. It should include placeholders or standard fields that can be updated by the scheduled AI task. The design should feel premium and institutional. Use a clean structure, clear section titles, readable tables and a professional visual hierarchy.

4. Scheduled AI Task Master Prompt

Objective: Define the master recurring prompt governing the weekly AI-assisted run.

Prompt text:

TASK TITLE: *Weekly Investment Views Database and Report Generator*

SCHEDULE: *Every Monday at 08:00 Europe/Paris*

MISSION: *Execute the Weekly Investment Views Database and Report Generator using the connected Google Drive.*

The workflow has two mandatory outputs:

- 1. Complete and validate the Google Sheet database.*
- 2. Duplicate the master Google Docs template and populate a new weekly draft.*

Do not generate the Google Doc before the weekly Google Sheet update is complete.

CORE FILES:

- *Use AI_Investment_Views_Source_Map_v1 as the exclusive workflow database and source of truth*
- *Use the human-edited Global Investment Views Monitor Draft V1 as the permanent master template and visual baseline*

Always create each weekly report by duplicating that exact native Google Doc. Never rebuild the document from blank. Never use a previously generated weekly draft as the formatting source. Never redesign or overwrite Draft V1.

INSTITUTIONAL UNIVERSE RULE: Only institutions explicitly listed in the Source Map tab may appear in Institutional Views, Supporting Institutions, Institutional Consensus, Institutional Divergences, Institutional View Changes, CIO / Strategist Signals

Never introduce an institution from open-web research if it is absent from Source Map. External public market-data sources may be used only to validate index levels or market moves. Label them as market-data sources. Never convert their commentary into an institutional view.

SOURCE RULES: Use only Source Map rows included in the weekly run.

Prioritize:

1. official institutional sources
2. recent sources
3. public and legally accessible sources
4. sources with clear publication dates
5. sources with direct relevance to investment views

Never bypass paywalls. Never invent sources, dates, figures, quotes, institutional views, thresholds, positions, publication titles, URLs

If something cannot be validated, write: “Not available” and flag it for human verification.

MANDATORY EXECUTION ORDER:

1. Complete and validate AI_Investment_Views_Source_Map_v1 for the covered week
2. Follow the same tab-by-tab population logic and data discipline used for the validated 28 July run
3. Use the completed Google Sheet as the report’s source of truth
4. Confirm that all cited institutions are present in the Source Map
5. Only after the Sheet is complete, duplicate the confirmed Draft V1 template
6. Populate the weekly report from the completed Sheet
7. Perform content, source, structure and character-format QA against Draft V1
8. Save the new weekly draft in 02_Drafts

GOOGLE SHEET UPDATE:

Review and append the required data to the following tabs, mapping to the actual tab names if names are slightly different:

- Source Checks
- Weekly Run Log
- Cross Asset Views
- Consensus Divergences
- Risk Dashboard
- Narrative Shifts
- Brief Output

Do not overwrite historical rows. Always append new rows for the current weekly run. The completed Sheet must remain the source of truth for the Google Doc.

TEMPLATE DUPLICATION RULE:

Duplicate Draft V1 into 02_Drafts. Name the new weekly output: Global_Investment_Views_Monitor_[covered-week-end-date]_Draft_V2

If a draft for that week already exists, use the next available version number.

Examples:

- *Global_Investment_Views_Monitor_[covered-week-end-date]_Draft_V3*
- *Global_Investment_Views_Monitor_[covered-week-end-date]_Draft_V4*
- *Global_Investment_Views_Monitor_[covered-week-end-date]_Draft_V5*

Keep:

- *Approval status = Draft*
- *Ready for Make = No*
- *Do not export to PDF*
- *Do not send the report*
- *Do not move it to 03_Ready_To_Send*

VISUAL AND FORMATTING RULES:

Preserve every visual and structural element from Draft V1, including:

- *page breaks*
- *section breaks*
- *table dimensions*
- *column widths*
- *paragraph styles*
- *character styles*
- *font*
- *font size*
- *colours*
- *bold and non-bold treatment*
- *alignment*
- *spacing*
- *indentation*
- *borders*
- *headers*
- *footers*

Replace only the variable text inside the copied document. Match the formatting of the corresponding V1 text or peer cell for every replacement. Do not apply blanket formatting to an entire paragraph or table. Do not create large blank spaces. Do not create unnecessary page breaks. Do not rebuild the document structure.

CHARACTER-FORMAT QA:

Before finalizing, run an explicit character-format QA against Draft V1. Compare corresponding text runs, not only paragraph or table structure. Pay special attention to:

- *the first content section*
- *the Process Optimization / Production Workflow area*
- *every lead-in label followed by a colon*
- *all DATA AS AT lines*
- *the footer*
- *all bold and non-bold boundaries*

Preserve the exact bold and non-bold boundaries. When V1 uses a bold lead-in label and regular body text, keep only the label bold. Never let inserted replacement text inherit bold across the full paragraph. If any bold and non-bold boundary differs from V1, correct it before saving the draft.

MACRO & MARKET BACKDROP:

In Macro & Market Backdrop, present Market Reaction as five separate bullet points in this fixed order:

- 1. MSCI World*
- 2. S&P 500*
- 3. STOXX Europe 600*
- 4. Shanghai Composite*
- 5. Nikkei 225*

Each bullet must use this format - Index: weekly variation | YTD variation

Weekly variation must be close-to-close for the completed week. YTD variation must run from the final close of the previous calendar year to the final close of the covered week. Round both figures consistently to one decimal place. State the measurement date and conventions. Cite identifiable public sources. Add only a concise interpretation of regional dispersion.

If a figure cannot be validated, write: Not available and flag it for human verification.

Never infer or invent figures.

CROSS-ASSET INTERPRETATION:

Keep Cross-Asset Interpretation concrete. Do not stop at broad categories such as:

- *equities*
- *rates*
- *credit*
- *FX*
- *commodities*

Where supported by the sources, specify:

- *region*
- *sector*

- *style*
- *duration*
- *credit segment*
- *currency*
- *commodity exposure*

Examples:

- *US equities*
- *European equities*
- *Swiss equities*
- *Japan equities*
- *China equities*
- *emerging market equities*
- *quality large caps*
- *technology*
- *semiconductors*
- *AI infrastructure*
- *healthcare*
- *financials*
- *industrials*
- *consumer discretionary*
- *investment grade credit*
- *high yield credit*
- *short duration bonds*
- *long duration government bonds*
- *US Treasuries*
- *European government bonds*
- *US dollar*
- *euro*
- *yen*
- *Swiss franc*
- *oil*
- *gold*

For each asset class, include:

- 1. the stance*
- 2. the supporting institutions*
- 3. the concrete segment*
- 4. the investment implication*
- 5. the evidence or figures when available*
- 6. what could weaken the view*

If sources do not provide enough detail, write: The reviewed sources do not provide enough detail to identify a more specific sub asset class preference.

INSTITUTIONAL VIEW CHANGES:

Institutional View Changes must identify the affected asset class and concrete positioning. For each view change, include:

- *institution*
- *previous tone if available*
- *current tone*
- *affected asset class*
- *region or market segment*
- *sector, style or theme if available*
- *evidence*
- *one concise Monitoring implication*

If a source provides only a macro view without a precise positioning change, state this explicitly: The source provides a macro view but does not state a precise investment positioning change.

Use only - Monitoring implication: for the final monitoring line.

Do not introduce separate Confirmation or Reversal fields. Keep the full Monitoring implication line bold when that is the VI treatment.

RISK MONITOR AND RISK COMMENTARY:

Use actual risk titles in the Risk Monitor table. Do not display: Risk 1, Risk 2, Risk 3, Risk 4

Use specific labels such as:

- *Central Bank Repricing*
- *Geopolitical Escalation*
- *Oil Supply Shock*
- *Inflation Reacceleration*
- *Credit Spread Widening*
- *AI Earnings Disappointment*
- *China Growth Disappointment*
- *Dollar Strength*
- *Valuation Concentration*

Risk Commentary must show:

- 1. assets at risk*
- 2. potential beneficiaries*
- 3. long-term investment implication*
- 4. monitoring focus*

For each risk, use this structure:

[Risk title]

Assets at risk: [Concrete asset classes, regions, sectors or styles that could be hurt.]

Potential beneficiaries: [Concrete asset classes, regions, sectors or styles that could benefit.]

Long-term implication: [Impact over the next quarters or years.]

Monitoring focus: [Data, prices or signals to watch.]

Do not invent opportunities. If sources do not provide enough evidence to identify beneficiaries, write: The reviewed sources do not provide enough detail to identify clear opportunity areas.

WRITING STYLE:

Use short sentences. Use precise wording. Use a clear logical chain. Avoid long sentences. Avoid heavy punctuation. Do not use semicolons. Do not use em dashes. Do not write generic market commentary. Each paragraph must make clear:

- 1. what happened*
- 2. how markets reacted*
- 3. how institutions interpreted it*
- 4. what the investment implication is*
- 5. what should be monitored*

Do not provide investment advice, recommendations, price targets or trading signals.

FINAL STATUS:

Keep:

Approval status = Draft

Ready for Make = No

Do not export to PDF. Do not send the report. Do not move the report to 03_Redy_To_Send.

FINAL COMPLETION NOTE:

Finish with a concise completion note including:

- *draft document name*
- *draft document link*
- *updated Google Sheet link*
- *tabs updated*
- *covered week*
- *number of sources reviewed*
- *number of sources included*
- *number of unavailable or paywalled sources*
- *main consensus theme*
- *main divergence*
- *highest risk*
- *human review required = Yes*

5. Source Discipline and Attribution Rules

Objective: Formalise the rules preventing unsupported attribution and source confusion.

Prompt text:

Rewrite and strengthen the source discipline rules for the Global Investment Views Monitor. The task must only use institutions and sources listed in the approved source map. The source map is the authorised source universe for the workflow. Macro and market media sources may be used to explain:

- *macroeconomic developments*
- *policy events*
- *index movements*
- *geopolitical risks*
- *market reactions*
- *weekly market backdrop*

However, macro and market media sources must not be presented as official institutional investment views. Official institutional investment views must come from approved institutional publications only. These may include public publications from private banks, asset managers, wealth management platforms, CIO teams or investment strategy departments, provided they are listed in the source map. CIO and strategist qualitative signals must be treated carefully. A CIO interview, strategist comment or public market note may indicate tone, emphasis or risk perception. However, it does not automatically represent a formal house view unless it is explicitly published as an official institutional position.

The rules must prevent:

- *unsupported attribution*
- *invented sources*
- *invented figures*
- *invented institutional positions*
- *confusion between market news and institutional views*
- *confusion between qualitative commentary and formal house views*
- *inference of institutional positioning from asset-level developments*

If a source is inaccessible, outdated, missing or incomplete, the task must flag it clearly instead of replacing it with unsupported information.

The output must distinguish:

- *confirmed institutional evidence*
- *market context*
- *analytical interpretation*
- *missing or unvalidated information*

6. Make Automation Setup

Objective: Build the post-validation distribution scenario in Make step by step.

Prompt text:

Guide me step by step to build the Make automation scenario for the Global Investment Views Monitor. The Make scenario should not perform investment analysis. It should only handle the operational distribution process after human validation. The workflow is:

- 1. The scheduled AI task creates a Google Docs draft in the draft folder*
- 2. The user reviews the draft manually*
- 3. If the report is validated, the user moves the Google Doc into the folder 03_Ready_To_Send*
- 4. Make detects the validated Google Doc*
- 5. Make converts the Google Doc into a PDF*
- 6. Make uploads the PDF into 04_PDF_Archive*
- 7. Make sends the PDF by email through Gmail*
- 8. Make moves the original Google Doc into 06_Sent_Docs*

Help me configure each Make module:

- *Google Drive Watch files in a folder*
- *filter based on the file name*
- *Google Drive Download a file as PDF*
- *Google Drive Upload a file to the PDF archive folder*
- *Gmail Send an email with PDF attachment*
- *Google Drive Move a file to the sent folder*

Tell me exactly which fields to fill, which variables to map and what common errors to avoid.

Important rules:

- *The file detected by the first Google Drive module is the original Google Doc*
- *The downloaded file is the PDF version*
- *The Gmail attachment must use the file from the Download a file module*
- *The final Move a file module must move the original Google Doc, not the PDF*
- *Make must only start after human validation, when the file enters 03_Ready_To_Send*

7. Usage Note

This prompt library is intended to support the project report and the GitHub repository. It documents the main instructions used to guide the AI during project design, workflow implementation, writing, review and positioning. It does not replace the project report, the source map, the example weekly brief or the Make automation evidence. Its role is to show that the use of generative AI was structured, deliberate and governed by explicit rules. In the final portfolio package, this document can be placed alongside the project report, the example weekly brief, the exported source map and selected workflow screenshots.
